About Project

NamoGram is a full-stack social media web application which provides users a platform for sharing content and connecting with others.
The project focuses on improving the social media experience through organized content discovery and meaningful audience analytics. Unlike traditional social media platforms that often rely on unrestricted hashtags and provide limited insights into audience behaviour, NamoGram introduces a controlled tagging system and a Creator Analytics Hub.

The application is built using the MERN technology stack, combining MongoDB, Express.js, Node.js, and EJS for server-side rendering.
